## PROJECT HIGHLIGHTS

- HAZCO responded to a pipe line break for a client in Alberta, Canada recovering and remediating condensate blended crude oil which had spread quickly over a large area of a neighbouring farmland.
- Approximately 500 cubic meters of product were recovered and 5000m<sup>3</sup> of contaminated soils were treated and piled.
- Excavation, transportation and disposal of blended crude oil was provided
- Coordination of equipment and labour for the immediate removal and disposal of free liquids and sludge via area oilfield service companies was coordinated
- HAZCO's excavators were mobilized within hours to begin stabilizing the remaining sludge and soils
- Crew and equipment were organized into shifts to provide 24 hrs/day remedial efforts around facility infrastructure
- HAZCO rock trucks and dozers were brought in to facilitate access to the spill zone for vacuum trucks, sealed top end dumps and truck and wagons. Hydrovac crews were organized to provide line locating and cleanup efforts around the facility infrastructure
